## Currencies done right

In most payment systems that went international, amounts are represented in integers, instead of decimals, as they are represented in minor currency units (smallest units possible).

For *EUR* it is [cent](#), which is 1/100 of a single [Euro](#). For *MRU* it is [khoums](#), which is 1/5 of a single [Ouguiya](#).

List of currencies is generated from a single CSV dump obtained from the [list of circulating currencies](#) Wikipedia page using the awesome [wikitable2csv](#).

**CHAPTER  
THREE**

---

**INSTALLATION**

Latest stable version on PyPI:

```
pip install valuta
```

Or development version from GitHub:

```
pip install https://github.com/barseghyanartur/valuta/archive/master.tar.gz
```

## USAGE EXAMPLES

### 4.1 Pure Python

#### 4.1.1 Using currency classes directly

##### 4.1.1.1 If you need numbers back for further calculations

```
import valuta

valuta.EUR.convert_to_currency_units(1_000)
# 10.0

valuta.UGX.convert_to_currency_units(1_000)
# 1000.0

valuta.MRU.convert_to_currency_units(1_000)
# 200.0

valuta.VND.convert_to_currency_units(1_000)
# 100.0

valuta.TND.convert_to_currency_units(1_000)
# 1.0

valuta.JPY.convert_to_currency_units(1_000)
# 10.0
```

##### 4.1.1.2 If you need to display the values and want a nice string back

```
import valuta

valuta.EUR.display_in_currency_units(1_000)
# '€10.00'

valuta.UGX.display_in_currency_units(1_000)
# 'UGX1,000'

valuta.MRU.display_in_currency_units(1_000)
```

(continues on next page)

(continued from previous page)

```
# 'MRU200.00'

valuta.VND.display_in_currency_units(1_000)
# 'đ100'

valuta.TND.display_in_currency_units(1_000)
# 'TND1.000'

valuta.JPY.display_in_currency_units(1_000)
# ¥10'
```

#### 4.1.1.2.1 Custom string formatting

Based on the specifics of the given currency, displayed numbers may have or not may have decimal points.

The `display_in_currency_units` method accepts optional `format`, `locale` and `decimal_quantization` arguments. Most common values for `format` are listed in the `valuta.constants`.

##### 4.1.1.2.1.1 format

###### DISPLAY\_FORMAT\_NUMBER

Example values: '10000' or '10000.00'.

###### DISPLAY\_FORMAT\_HUMAN\_READABLE

Displays a human readable number.

Example values: '10,000' or '10,000.00'.

###### DISPLAY\_FORMAT\_HUMAN\_READABLE\_WITH\_CURRENCY\_CODE

Displays a human readable number with currency code.

Example values: 'JPY 10,000' or 'EUR 10,000.00'.

###### DISPLAY\_FORMAT\_HUMAN\_READABLE\_WITH\_CURRENCY\_SYMBOL

Displays a human readable number with currency symbol.

Example values: '¥ 10,000' or '€ 10,000.00'.

A couple of examples:

```
from valuta.constants import *

valuta.JPY.display_in_currency_units(
    1_000_000,
    format=DISPLAY_FORMAT_HUMAN_READABLE
)
# '10,000'

valuta.JPY.display_in_currency_units(
    1_000_000,
    format=DISPLAY_FORMAT_HUMAN_READABLE_WITH_CURRENCY_CODE
)
```

(continues on next page)

(continued from previous page)

```
# 'JPY 10,000'

valuta.JPY.display_in_currency_units(
    1_000_000,
    format=DISPLAY_FORMAT_HUMAN_READABLE_WITH_CURRENCY_SYMBOL
)
# '¥ 10,000'

valuta.EUR.display_in_currency_units(
    1_000_000,
    format=DISPLAY_FORMAT_HUMAN_READABLE
)
# '10,000.00'

valuta.EUR.display_in_currency_units(
    1_000_000,
    format=DISPLAY_FORMAT_HUMAN_READABLE_WITH_CURRENCY_CODE
)
# 'EUR 10,000.00'

valuta.EUR.display_in_currency_units(
    1_000_000,
    format=DISPLAY_FORMAT_HUMAN_READABLE_WITH_CURRENCY_SYMBOL
)
# '€ 10,000.00'
```

#### 4.1.1.2.1.2 locale

```
valuta.JPY.display_in_currency_units(1_000_000_000, locale="nl_NL")
# 'JP¥\xa010.000.000'

valuta.JPY.display_in_currency_units(1_000_000_000, locale="en_US")
# '$10,000,000'

valuta.EUR.display_in_currency_units(1_000_000_000, locale="nl_NL")
# '\xa010.000.000,00'

valuta.EUR.display_in_currency_units(1_000_000_000, locale="en_US")
# '€10,000,000.00'

valuta.AMD.display_in_currency_units(1_000_000_000, locale="en_US")
# 'AMD10,000,000.00'

valuta.AMD.display_in_currency_units(1_000_000_000, locale="hy_AM")
# '10 000 000,00'
```

## 4.1.2 Working with string representations of the (ISO-4217) currency codes

### 4.1.2.1 If you need numbers back for further calculations

```
from valuta.shortcuts import convert_to_currency_units

convert_to_currency_units("EUR", 1_000)
# 10.0

convert_to_currency_units("UGX", 1_000)
# 1000.0

convert_to_currency_units("MRU", 1_000)
# 200.0

convert_to_currency_units("VND", 1_000)
# 100.0

convert_to_currency_units("TND", 1_000)
# 1.0

convert_to_currency_units("JPY", 1_000)
# 10.0
```

### 4.1.2.2 If you need to display the values and want a nice string back

```
from valuta.shortcuts import display_in_currency_units

display_in_currency_units("EUR", 1_000)
# '€10.00'

display_in_currency_units("UGX", 1_000)
# 'UGX1,000'

display_in_currency_units("MRU", 1_000)
# 'MRU200.00'

display_in_currency_units("VND", 1_000)
# 'đ100'

display_in_currency_units("TND", 1_000)
# 'TND1.000'

display_in_currency_units("JPY", 1_000)
# ¥10'
```

By default, exceptions arising from invalid currency codes are suppressed (None will be returned on invalid currency codes).

If you want to throw exception on invalid currency codes, set `fail_silently` to `False`. The following example will throw a `valuta.exceptions.InvalidCurrency` exception.

```
convert_to_currency_units("i-dont-exist", 1_000, fail_silently=False)
```

The `display_in_currency_units` shortcut function also accepts optional `format` argument.

## 4.2 Django integration

In its basis, Django integration package is a `CurrencyField` representing the ISO-4217 codes of the currencies. If bound to certain number fields (`SmallIntegerField`, `IntegerField`, `BigIntegerField`) holding the amount in minor currency units, it adds up (magic) methods to the model class for converting field amounts to major currency units (often simply called **currency units**).

There are also *template tags and filters* for when you need to render non-model data (for instance, JSON) in templates without prior pre-processing.

### 4.2.1 Model field

#### 4.2.1.1 Model definition

##### Sample model

`product/models.py`

```
from django.db import models
from valuta.contrib.django_integration.models import CurrencyField

class Product(models.Model):

    name = models.CharField(max_length=255)
    price = models.IntegerField() # Amount in minor currency units
    price_with_tax = models.IntegerField() # Amount in minor currency units
    currency = CurrencyField(amount_fields=["price", "price_with_tax"])
```

##### Sample data

```
import valuta
from product.models import Product
product = Product.objects.create(
    name="My test product",
    price=100,
    price_with_tax=120,
    currency=valuta.AMD.uid,
)
```

#### 4.2.1.2 Converting amounts using *magic methods*

You could then refer to the `price` and `price_with_tax` as follows:

```
product.price_in_currency_units()  
# 1.0  
product.price_with_tax_in_currency_units()  
# 1.2
```

Note, that every field listed in the `amount_fields` gets a correspondent model method with suffix `_in_currency_units` for converting the field amounts to (major) currency units.

#### 4.2.1.3 Converting amounts for display using *magic methods*

You could then refer to the `price` and `price_with_tax` as follows:

```
product.price_display_in_currency_units()  
# 'AMD1.00'  
product.price_with_tax_display_in_currency_units()  
# 'AMD1.20'
```

Note, that every field listed in the `amount_fields` gets a correspondent model method with suffix `_display_in_currency_units` for converting the field amounts to (major) currency units.

Magic methods also accept optional `format` argument.

```
product = Product.objects.create(  
    name="My test product",  
    price=100_000,  
    price_with_tax=120_000,  
    currency=valuta.EUR.uid,  
)  
  
product.price_display_in_currency_units(  
    format=DISPLAY_FORMAT_HUMAN_READABLE_WITH_CURRENCY_SYMBOL  
)  
# '€ 1,000.00'  
product.price_with_tax_display_in_currency_units(  
    format=DISPLAY_FORMAT_HUMAN_READABLE_WITH_CURRENCY_CODE  
)  
# 'EUR 1,200.00'
```

Combining `format` and `locale` arguments.

```
product.price_display_in_currency_units(  
    format=DISPLAY_FORMAT_HUMAN_READABLE_WITH_CURRENCY_SYMBOL,  
    locale="nl_NL")  
# '€ 1.000,00'  
product.price_with_tax_display_in_currency_units(  
    format=DISPLAY_FORMAT_HUMAN_READABLE_WITH_CURRENCY_CODE,  
    locale="nl_NL")  
# 'EUR 1.200,00'
```

#### 4.2.1.4 Limiting the currency choices

##### 4.2.1.4.1 On the field level

You could limit the currency choices as follows:

```
currency = CurrencyField(
    amount_fields=["price", "price_with_tax"],
    limit_choices_to=[valuta.AMD.uid, valuta.EUR.uid],
)
```

##### 4.2.1.4.2 Globally

You could also override the `CurrencyField` choices in the Django settings:

`settings.py`

```
VALUTA_FIELD_LIMIT_CHOICES_TO=(
    valuta.AMD.uid,
    valuta.EUR.uid,
)
```

#### 4.2.1.5 Casting the converted values

If you want to explicitly cast the result value to a certain type, provide a callable `cast_to` for the `CurrencyField`.

##### 4.2.1.5.1 For `int` it would be

```
currency = CurrencyField(
    amount_fields=("price", "price_with_tax",),
    cast_to=int,
)
```

##### 4.2.1.5.2 For `float` it would be

```
currency = CurrencyField(
    amount_fields=("price", "price_with_tax",),
    cast_to=float,
)
```

#### 4.2.1.5.3 For `decimal.Decimal` it would be

```
currency = CurrencyField(  
    amount_fields=("price", "price_with_tax",),  
    cast_to=lambda __v: Decimal(str(__v)),  
)
```

#### 4.2.1.6 Customize the choices display format

By default, the following format is used (`valuta.utils.get_currency_choices_with_code`):

```
[  
    ("AMD", "Armenian Dram (AMD)"),  
    ("EUR", "Euro (EUR)'),  
]
```

If you want to customize that, provide a callable `get_choices_func` along:

```
from valuta.utils import get_currency_choices  
  
currency = CurrencyField(  
    amount_fields=("price", "price_with_tax",),  
    get_choices_func=get_currency_choices,  
)
```

It would then have the following format:

```
[  
    ("AMD", "Armenian Dram"),  
    ("EUR", "Euro"),  
]
```

Take both `valuta.utils.get_currency_choices` and `valuta.utils.get_currency_choices_with_code` as a good example of how to customize. You could for instance do something like this:

```
import operator  
from typing import List, Tuple, Set, Union  
  
from babel.numbers import get_currency_symbol  
from valuta.base import Registry  
  
def get_currency_choices_with_sign(  
    limit_choices_to: Union[Tuple[str, ...], List[str], Set[str]] = None,  
    sort_by_key: bool = False,  
) -> List[Tuple[str, str]]:  
    """Get currency choices with code.  
  
    List of choices in the following format::  
  
    [  
        ("AMD", "AMD - Armenian Dram"),  
        ("EUR", "€ - Euro"),  
    ]
```

(continues on next page)

(continued from previous page)

```

        ("USD", "$ - US Dollar"),
    ]
"""

if limit_choices_to is None:
    values = [
        (_key, f"get_currency_symbol({_key}) - {_value.name}")
        for _key, _value in Registry.REGISTRY.items()
    ]
else:
    values = [
        (_key, f"get_currency_symbol({_key}) - {_value.name}")
        for _key, _value in Registry.REGISTRY.items()
        if _key in limit_choices_to
    ]
if sort_by_key:
    values.sort(key=operator.itemgetter(0))
else:
    values.sort(key=operator.itemgetter(1))
return values

```

And then use it as follows:

```

currency = CurrencyField(
    amount_fields=("price", "price_with_tax",),
    get_choices_func=get_currency_choices_with_sign,
)

```

## 4.2.2 Template tags and filters

Most of the cases would be covered by the [Model field](#), but it could be that you will have non-model data (for instance, JSON) that you need to properly render in the templates (without prior pre-processing). In that case `valuta_tags` template tags/filters library might help.

### 4.2.2.1 Template tags prerequisites

If you want to use `templatetags` library, you need to add `valuta.contrib.django_integration` to your `INSTALLED_APPS`:

```

INSTALLED_APPS = (
    # ...
    "valuta.contrib.django_integration",
    # ...
)

```

If you want to make use of pre-defined rendering formats, it might be useful to add `valuta.contrib.django_integration.context_processors.constants` to the `context_processors`.

```

TEMPLATES = [
    # ...
    "OPTIONS": {

```

(continues on next page)

(continued from previous page)

```
# ...
"context_processors": [
    "django.template.context_processors.debug",
    "django.template.context_processors.request",
    "django.contrib.auth.context_processors.auth",
    "django.contrib.messages.context_processors.messages",
    "valuta.contrib.django_integration.context_processors.constants",
],
# ...
},
# ...
}]
```

#### 4.2.2.2 Sample data

```
instance = {
    "price": 1_000,
    "price_with_tax": 1_200,
    "currency_code": "EUR",
}
```

#### 4.2.2.3 Without formatting

##### 4.2.2.3.1 Sample template filters template

*template\_filter\_price\_in\_currency\_units.html*

```
{% load valuta_tags %}

{{ instance.price|convert_to_currency_units:instance.currency_code }}
```

##### 4.2.2.3.2 Sample template filters renderer

```
from django.template.loader import render_to_string

render_to_string(
    "template_filter_price_in_currency_units.html", {"instance": instance}
)
```

#### 4.2.2.3.3 Sample template tags template

*template\_tag\_price\_in\_currency\_units.html*

```
{% load valuta_tags %}

{% convert_to_currency_units instance.price instance.currency_code %}
```

#### 4.2.2.3.4 Sample template tags renderer

```
from django.template.loader import render_to_string

render_to_string(
    "template_tag_price_in_currency_units.html", {"instance": instance}
)
```

### 4.2.2.4 With formatting

#### 4.2.2.4.1 Sample template filters template

*template\_filter\_price\_display\_in\_currency\_units.html*

```
{% load valuta_tags %}

{{ instance.price|display_in_currency_units:instance.currency_code }}
```

#### 4.2.2.4.2 Sample template filters renderer

```
from django.template.loader import render_to_string

render_to_string(
    "template_filter_price_display_in_currency_units.html", {"instance": instance}
)
```

#### 4.2.2.4.3 Sample template tags template

*template\_tag\_price\_display\_in\_currency\_units.html*

```
{% load valuta_tags %}

{% display_in_currency_units instance.price instance.currency_code %}
```

You can also display units in specific format (including the currency symbol). Most common use-cases are pre-defined in `valuta.constants` and if you have included the correspondent context processor as instructed above, you could use it as follows:

```
{% load valuta_tags %}

{% display_in_currency_units instance.price instance.currency_code DISPLAY_FORMAT_HUMAN_
˓→READABLE_WITH_CURRENCY_CODE %}
```

For the full list of options, see [Custom string formatting](#).

#### 4.2.2.4.4 Sample template tags renderer

```
from django.template.loader import render_to_string

render_to_string(
    "template_tag_price_display_in_currency_units.html", {"instance": instance}
)
```

## 4.3 SQLAlchemy integration

Similarly to Django integration package, the SQLAlchemy integration package is a simple `CurrencyType` representing the ISO-4217 codes of the currencies.

No magic methods are implemented yet (although planned to). What you get is a simple SQLAlchemy type for storing the data. For the rest you will have to make use of the `valuta.shortcuts`.

See `examples/sqlalchemy_example/valuta_admin/models.py` as a good example.

### 4.3.1 Model definition

#### Sample model

`product/models.py`

```
from valuta.contrib.sqlalchemy_integration.types import CurrencyType
from . import db # Standard SQLAlchemy way

class Product(db.Model):

    id = db.Column(db.Integer, primary_key=True)
    name = db.Column(db.Unicode(64), unique=True)
    price = db.Column(db.Integer())
    price_with_tax = db.Column(db.Integer())
    currency = db.Column(CurrencyType())
```

#### Sample data

```
import valuta
from product.models import Product
product = Product(
    name="My test product",
    price=100,
    price_with_tax=120,
```

(continues on next page)

(continued from previous page)

```
    currency=valuta.AMD.uid,  
)
```

## 13.1 Release history and notes

Sequence based identifiers are used for versioning (schema follows below):

```
major.minor[.revision]
```

- It's always safe to upgrade within the same minor version (for example, from 0.3 to 0.3.4).
- Minor version changes might be backwards incompatible. Read the release notes carefully before upgrading (for example, when upgrading from 0.3.4 to 0.4).
- All backwards incompatible changes are mentioned in this document.

### 13.1.1 0.3.2

2021-07-13

- Add basic SQLAlchemy support.

### 13.1.2 0.3.1

2021-07-01

- Suppress weirdest bug with a strange character \xa0 appearing when using template tags without providing a locale on GitHub actions (locally everything passes without the bug).

### 13.1.3 0.3

2021-06-29

---

**Note:** This release is somewhat incompatible with previous versions for what's related to the displaying value in currency units (using any `display_in_currency_units` or shortcuts). If you want old behaviour, add `format=DISPLAY_FORMAT_NUMBER` to places where you used `display_in_currency_units` method or a correspondent shortcut function.

- Add `locale` and `decimal_quantization` args to the `format_currency` everywhere.
- Do not provide a default value for `format` (follow the babel defaults approach).

### 13.1.4 0.2.1

2021-06-25

- Added `valuta.contrib.djangoproject_integrations.context_processors.constants` context processor module.
- Documentation improvements.

### **13.1.5 0.2**

2021-06-24

- Added `display_in_currency_units` method, `shortcuts` module function and a magic method to the Django integration package, as well as the template tags library.

### **13.1.6 0.1.9**

2021-06-15

- Minor fixes in the Django app (for Django 2.2).

### **13.1.7 0.1.8**

2021-06-15

- Added `templatetags` library for Django integration app.

### **13.1.8 0.1.7**

2021-06-05

- Replace all imports from `valuta.registry` with imports from `valuta.base`.
- Documentation improvements.

### **13.1.9 0.1.6**

2021-06-04

- Move `Registry` class from `valuta.registry` to `valuta.base`.
- Add `valuta.shortcuts` module as shorthand for when you have a string representation of the currency code and the value to convert and don't want to handle possible exceptions.

### **13.1.10 0.1.5**

2021-05-23

- Add more tests.
- Add an argument `--sort-by-value` for `valuta-list-currencies` command.

### **13.1.11 0.1.4**

2021-05-20

- Add more tests.

### **13.1.12 0.1.3**

2021-05-19

- Minor fixes.

### **13.1.13 0.1.2**

2021-05-19

- Change of the default display format in the Django integration app.
- Allow customization of the display format in the Django integration app.

### **13.1.14 0.1.1**

2021-05-19

- Improve docs.
- Clean up.
- Minor fixes.

### **13.1.15 0.1**

2021-05-17

- Initial beta release.

#### 13.2.1.3.1 Submodules

#### 13.2.1.3.2 valuta.tests.data module

#### 13.2.1.3.3 valuta.tests.test\_base module

```
class valuta.tests.test_base.TestBase(methodName='runTest')
Bases: unittest.case.TestCase
```

Base tests.

**setUp()** → None

Hook method for setting up the test fixture before exercising it.

**tearDown()** → None

Hook method for deconstructing the test fixture after testing it.

**test\_1()**

**test\_10()**

**test\_100()**

**test\_1000()**

**test\_5()**

**test\_subclass()**

Test subclass.

**test\_subclass\_no\_rate()**

Test subclass no *rate*.

**test\_symbol()**

Test symbol.

#### 13.2.1.3.4 valuta.tests.test\_cli module

**class** valuta.tests.test\_cli.TestCLI(*methodName='runTest'*)

Bases: unittest.case.TestCase

CLI tests.

**test\_generate\_currencies()**

Test generate currencies CLI.

**test\_list\_currencies()**

Test list currencies CLI.

**test\_list\_currencies\_sort\_by\_value()**

Test list currencies CLI, sorted by value.

#### 13.2.1.3.5 valuta.tests.test\_registry module

**class** valuta.tests.test\_registry.TestRegistry(*methodName='runTest'*)

Bases: unittest.case.TestCase

Test registry.

**test\_import\_from\_registry()**

Test import from deprecated *valuta.registry* module.

### 13.2.1.3.6 valuta.tests.test\_scaffolding module

```
class valuta.tests.test_scaffolding.TestScaffolding(methodName='runTest')
    Bases: unittest.case.TestCase

    Scaffolding tests.

    test_generate_currencies()
        Test generate currency modules.

    test_generate_currencies_rel_path()
        Test generate currency modules relative paths.
```

### 13.2.1.3.7 valuta.tests.test\_shortcuts module

```
class valuta.tests.test_shortcuts.TestShortcuts(methodName='runTest')
    Bases: unittest.case.TestCase

    Test shortcuts.

    test_convert_to_currency_units()
        Test convert_to_currency_units with valid codes.

    test_display_in_currency_units()
        Test display_in_currency_units with valid codes.

    test_display_in_currency_units_with_locale()
        Test display_in_currency_units with valid codes and locale.

    test_test_convert_to_currency_units_invalid_currency_code()
        Test convert_to_currency_units with invalid codes.

    test_test_display_in_currency_units_invalid_currency_code()
        Test convert_to_currency_units with invalid codes.
```

### 13.2.1.3.8 valuta.tests.test\_utils module

```
class valuta.tests.test_utils.TestTools(methodName='runTest')
    Bases: unittest.case.TestCase

    Test utils.

    setUp()
        Set up.

    test_get_currency_choices()
        Test get_currency_choices.

    test_get_currency_choices_sort_by_key()
        Test get_currency_choices sort_by_key=True.

    test_get_currency_choices_with_code()
        Test get_currency_choices_with_code.

    test_get_currency_choices_with_code_sort_by_key()
        Test get_currency_choices_with_code sort_by_key=True.
```

### 13.2.1.3.9 Module contents

## 13.2.2 Submodules

### 13.2.3 valuta.base module

```
class valuta.base.BaseCurrency
```

Bases: object

Base currency.

Each currency typically has a main currency unit (the dollar, for example, or the euro) and a fractional unit, often defined as 1/100 of the main unit: 100 cents = 1 dollar, 100 centimes = 1 franc, 100 pence = 1 pound, although units of 1/10 or 1/1000 occasionally also occur. Some currencies do not have any smaller units at all, such as the Icelandic krona.

<https://en.wikipedia.org/wiki/Currency>

```
classmethod convert_to_currency_units(value: int) → Union[int, float, decimal.Decimal]
```

Convert to amount in currency units.

```
classmethod display_in_currency_units(value: int, format: Optional[str] = None, locale: Optional[str] = None, decimal_quantization: bool = True) → str
```

Convert to amount in currency units.

```
name = None
```

```
rate: Union[int, float, decimal.Decimal]
```

```
symbol = None
```

```
uid: Optional[str] = None

### 13.2.4 valuta.cli module

`valuta.cli.generate_currencies()`  
Generate currency modules.

`valuta.cli.list_currencies()`  
List currency modules.

### 13.2.5 valuta.exceptions module

`exception valuta.exceptions.ImproperlyConfigured`  
Bases: `Exception`  
  
ImproperlyConfigured.  
Supposed to be thrown when code is improperly configured.

`exception valuta.exceptions.InvalidCurrency`  
Bases: `ValueError`  
  
Invalid currency exception.

### 13.2.6 valuta.helpers module

`class valuta.helpers.ClassProperty(fget=None, fset=None, fdel=None, doc=None)`  
Bases: `property`

ClassProperty.

How to use:

```

class Something:
    @classproperty
    def default_value(cls):
        return 10 # Some value

```

Can be replaced with the following in Python 3.9:

```

class Something:
    @classmethod
    @property
    def default_value(cls):
        return 10 # Some value

```

`valuta.helpers.classproperty`

alias of `valuta.helpers.ClassProperty`

`valuta.helpers.project_dir(base: str) → str`

Absolute path to a file from current directory.
